

Bitrix24 Content Ticket Generator

Overview

This system allows users to upload an Excel sheet containing content issues and automatically generate Bitrix24 tickets.

The system should intelligently map uploaded values to Bitrix list fields and validate relationships between hierarchical entities before ticket creation.

Goal

Reduce manual ticket creation by allowing bulk upload through Excel while ensuring:

- Data integrity
- Correct field mapping
- Hierarchical validation
- User-friendly error reporting

Input Source

User uploads an Excel file.

Example columns:

Subject	Grade	Semester	Unit	Lesson
Science	Grade 6	S1	الفصل الأول - الخلايا	نظرية الخلية
Science	Grade 6	S1	الفصل الأول - الخلايا	الخلية النباتية والخلية الحيوانية
Science	Grade 6	S1	الفصل الثاني - الخلية والوراثة	الوراثة والصفات

Bitrix Entity

Entity Type ID = 1440

Field Mapping

Excel Column	Bitrix Field
Subject	ufCrm160_1753097067673
Grade	ufCrm160_1758428558312
Semester	ufCrm160_1758428597597
Unit	ufCrm160_1772448761296
Lesson	ufCrm160_1772448754224
Domain	ufCrm160_1753097131073
Topic	ufCrm160_1753097139961
Outcome	ufCrm160_1753097183198
Skill	ufCrm160_1753097189922
Item Type	ufCrm160_1753614725454

Hierarchy Validation

The system must not treat each field independently.

Fields are related and should be validated sequentially.

Hierarchy:

Validation Logic

When a row is uploaded:

Step 1

Find Subject.

Example:

Science

Retrieve Subject ID.

Step 2

Find Grade under selected Subject.

Example:

Science
Grade 6

Only Grade values related to Science should be considered.

Step 3

Find Semester under:

Science
Grade 6

Example:

S1

Step 4

Find Unit under:

Science
Grade 6
S1

Example:

الفصل الأول - الخلايا

Step 5

Find Lesson under:

Science
Grade 6
S1
الفصل الأول - الخلايا

Example:

نظرية الخلية

Only lessons belonging to the selected Unit should be considered valid.

Smart Lookup Engine

Instead of matching by text only:

The system should build lookup dictionaries from Bitrix data.

Example:

```
{  
  "Science": {
```

```
"Grade 6": {  
  "S1": {  
    "الفصل الأول - الخلايا": [  
      "نظرية الخلية",  
      "الخلية النباتية والخلية الحيوانية"  
    ]  
  }  
}
```

This allows validation before ticket creation.

Upload Validation

Before creating tickets:

Validate every row.

Valid Row

```
Science  
Grade 6  
S1  
الفصل الأول - الخلايا  
نظرية الخلية
```

Result:

READY

Invalid Lesson

```
Science  
Grade 6  
S1
```

الفصل الأول - الخلايا
درس غير موجود

Result:

ERROR
Lesson not found under selected Unit

Invalid Unit

Science
Grade 6
S1
وحدة غير موجودة

Result:

ERROR
Unit not found under Subject / Grade / Semester

Preview Screen

Before creating tickets:

Display validation results.

Example:

Row	Status	Message
1	Valid	Ready
2	Error	Lesson not found
3	Error	Invalid Unit

User can review before submission.

Ticket Creation

Only valid rows should be processed.

For each valid row:

```
{
  "entityTypeId": 1440,
  "fields": {
    "ufCrm160_1753097067673": "<subjectId>",
    "ufCrm160_1758428558312": "<gradeId>",
    "ufCrm160_1758428597597": "<semesterId>",
    "ufCrm160_1772448761296": "<unitId>",
    "ufCrm160_1772448754224": "<lessonId>"
  }
}
```

Bulk Processing Requirements

- Support 1000+ rows per upload.
- Batch ticket creation.
- Skip invalid rows.
- Generate processing report.
- Export failed rows.

Output

After processing:

Success Report

Created	Failed
950	50

Error File

Downloadable Excel containing:

Row	Error
15	Lesson not found
27	Unit not found
48	Grade mismatch

Future Enhancements

- Auto-suggest corrections for invalid values.
- Fuzzy matching.
- Duplicate detection.
- Ticket update mode.
- AI-assisted mapping recommendations.
